

The opportunigties hinted at by the introduction of BPL must be balanced with the interference that it will cause to other critical functions, such as the amateur radio service. Looking at results from Japan and other countries, BPL as we currently understand it would likely provide a level of interference to make the amateur radio service difficult if not impossible to use.

There are laws preventing unauthorized rf emissions and BPL must be treated in this light. Clean up the interference in the radio spectrum and BPL could mature to be an incredibly useful technology.

Sincerely
Neal Campbell
